

Support doesn't have to be uncomfortable.

These unique one piece braces immobilize the patient from the sacrococcygeal junction to above L1 for the LS and above the T9 vertebra for the ProLift and Prolift Plus. The split front panel helps center the brace on the patient. The Xback strapping system provides for intercavitory pressure and hydrostatic lift to help hold the weight of the abdomen, reducing the load on the intervertebral discs thus reducing lower back pain. These lightweight braces are thinner, lighter, cooler, and less bulky than most other braces providing maximum comfort. They weigh just 22 ounces and are easy for patients to put on, providing comfortable support for a variety of diagnoses. They're also available with XactTemp ice pads.

The new adjustable strap can be adjusted over and over again accomodating weight gain or loss by the patient.

It's the only brace they'll ever need.
